

NMFC Docket Subject Number: 193100

Rightline Equipment

We provide attachments for lift trucks and the new cubic density is not accurate for our products. A lot of our products ship with the forks installed which make them L-shaped and not a cube. This allows freight to be stacked inside the technical cubic space we are charged for which means this new standard is not a correct representation of how the freight actually moves. Please see attached pics and note how the skids have multiple skids in the same cubic space with different Pro#'s or can easily have stuff stacked on the forks. Flat or cubic items are not an issue.
